## Radio air shower detector at Icecube

Astroteilchenschule  
17.09.2009

# Outline

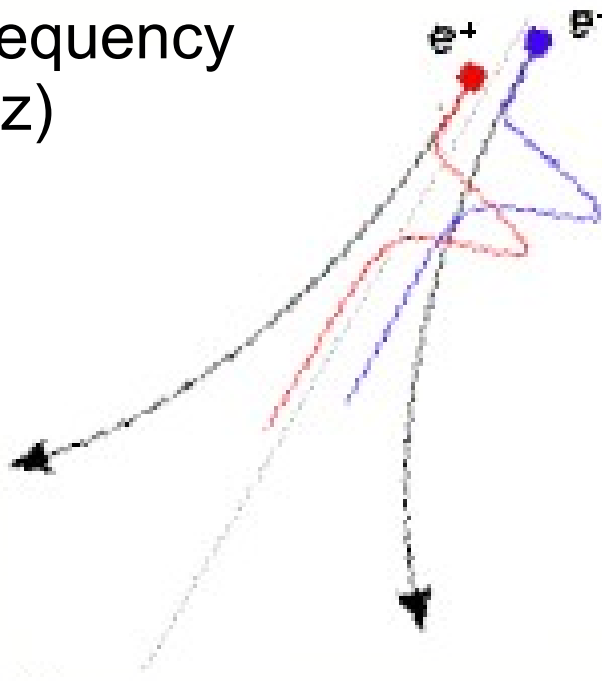

Synchrotron effect in Earth's magnetic field  
three component air shower detector  
Radio antenna  
Voltage Standing Wave Ratio (VSWR)  
Measurement of VSWR  
Compare the VSWR with Simulation  
Spectrum from Wuppertal  
Outlook

# Synchrotron effect in Earth's magnetic field

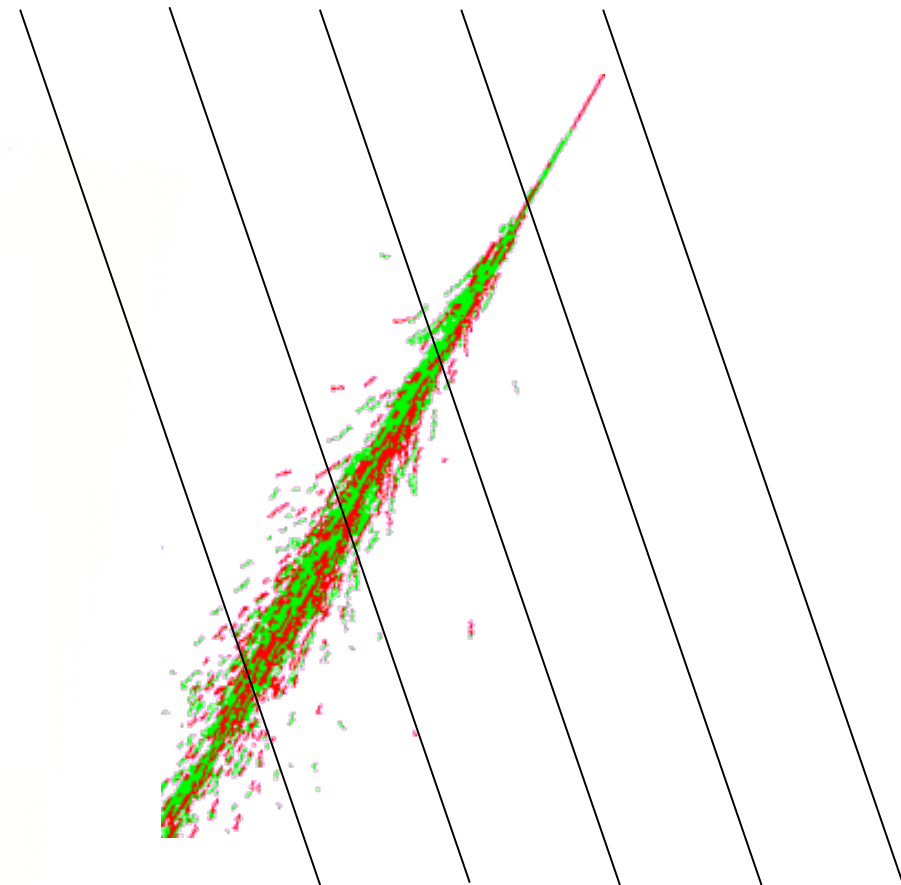

Geo-synchrotron effect: electro magnetic charged particles in earths magnetic field

Short radio pulses in time  
(length: few 10ns)

Broad in frequency  
(1-150 MHz)

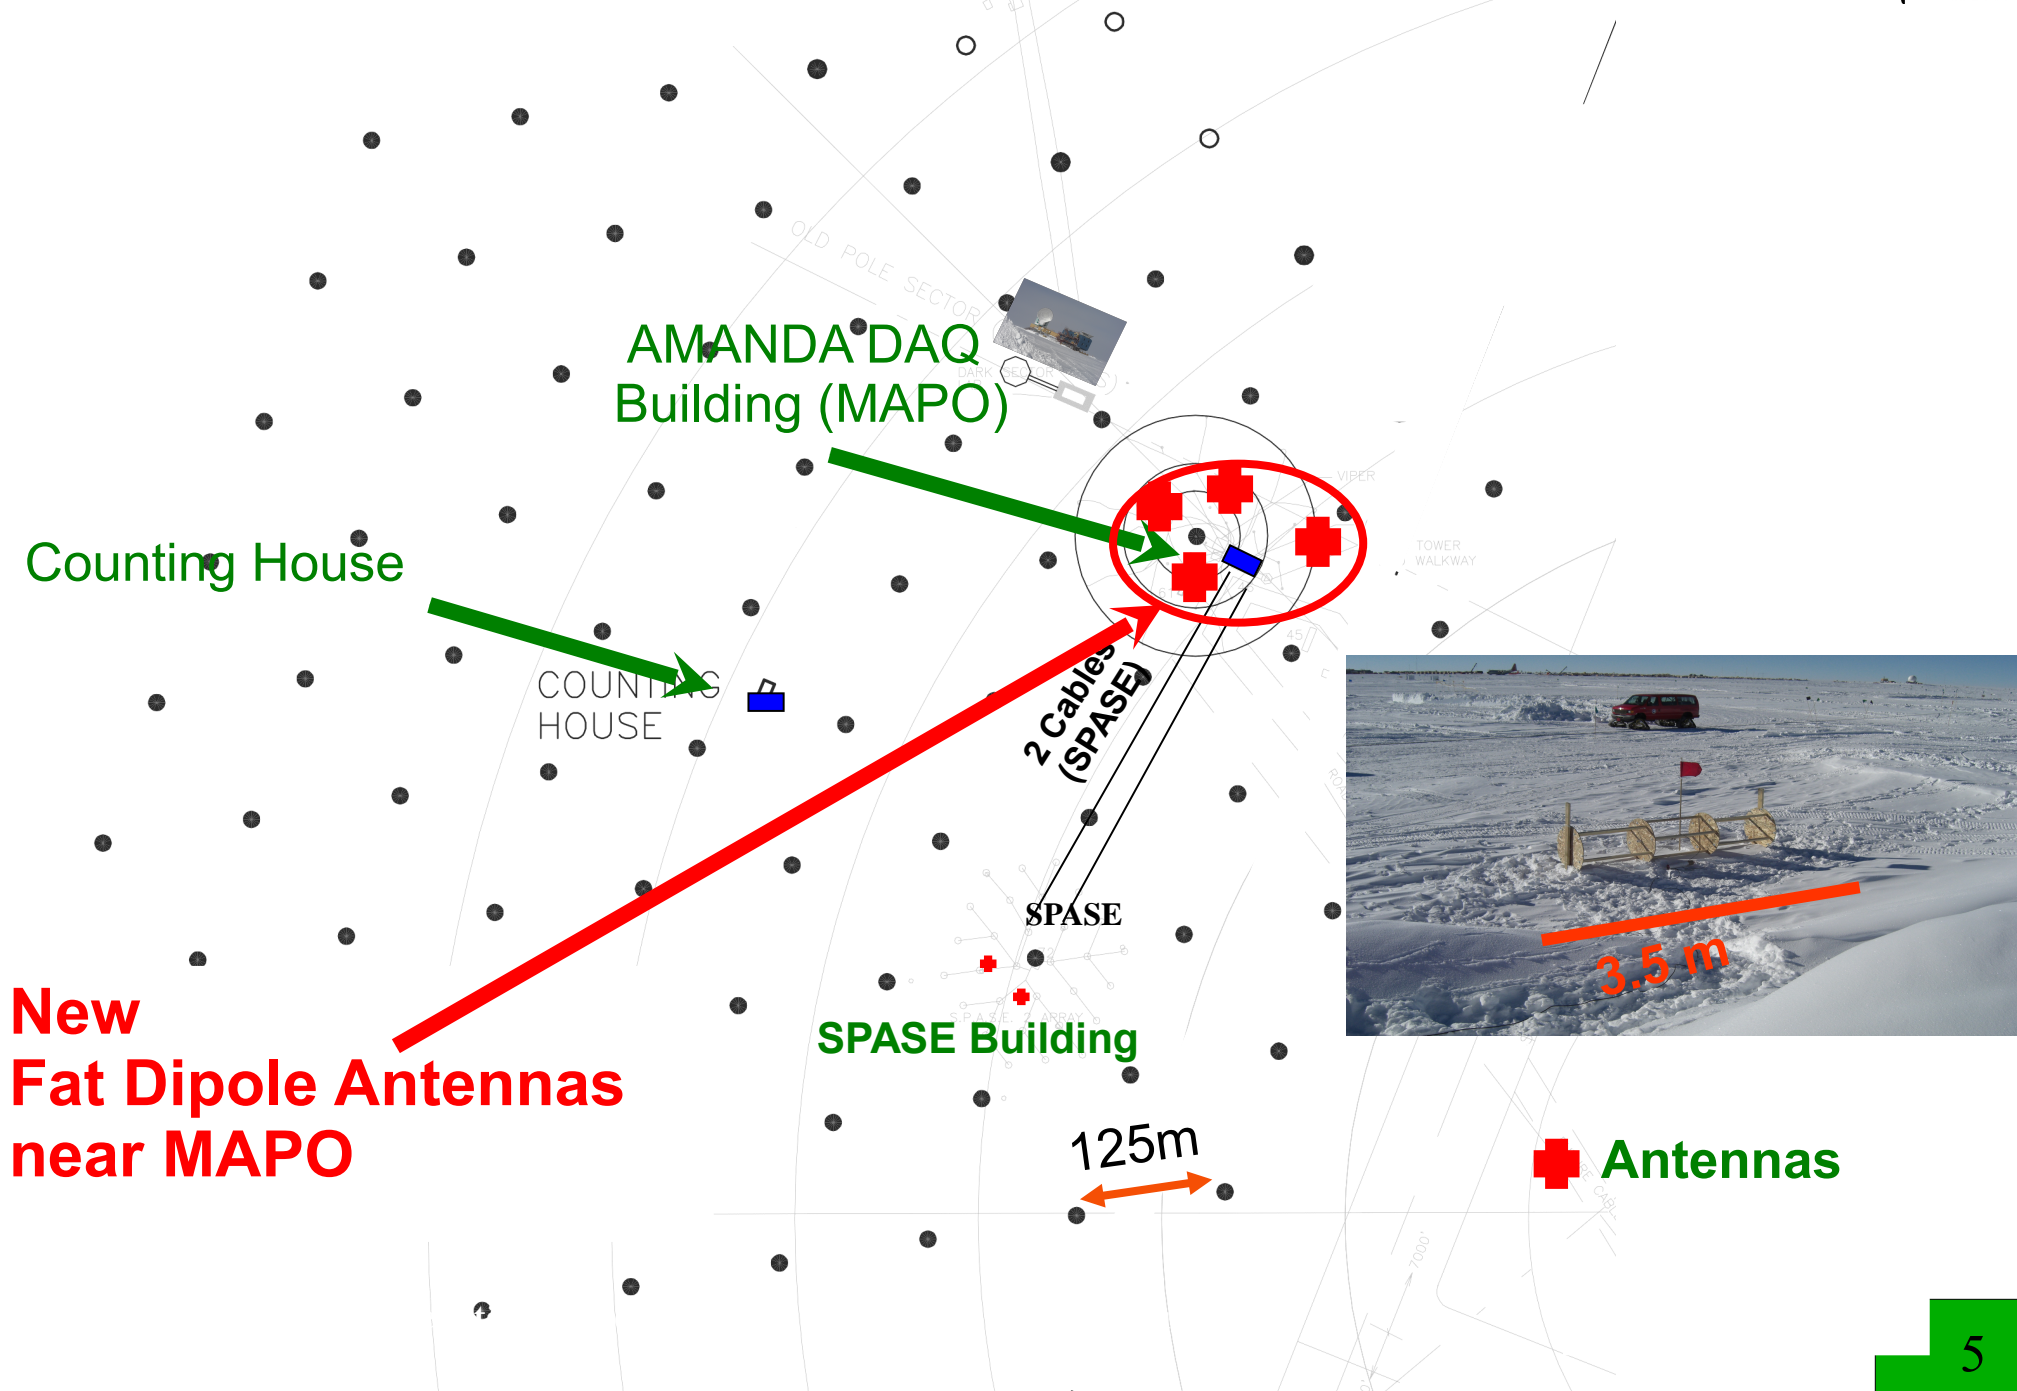

B-Field

# Primary goal: A three component air shower detector

# Deployment Configuration

# The Antenna

Fat wire dipole

Developed for a frequency range  
 from 25 to 100MHz

Length about 3.5 meter

Diameter 76cm

Weight 32 Kg

# Voltage Standing Wave Ratio - (V)SWR

The impedance of the antenna is different to the impedance of the transmission line.

The match of the antenna to the transmission line can be expressed as voltage standing wave ratio

$$S = \frac{U_{Max}}{U_{Min}} = \frac{U_{forward} + U_{reflected}}{U_{forward} - U_{reflected}} = \frac{U_{forward}(1 + R)}{U_{forward}(1 - R)} = \frac{1 + R}{1 - R}$$

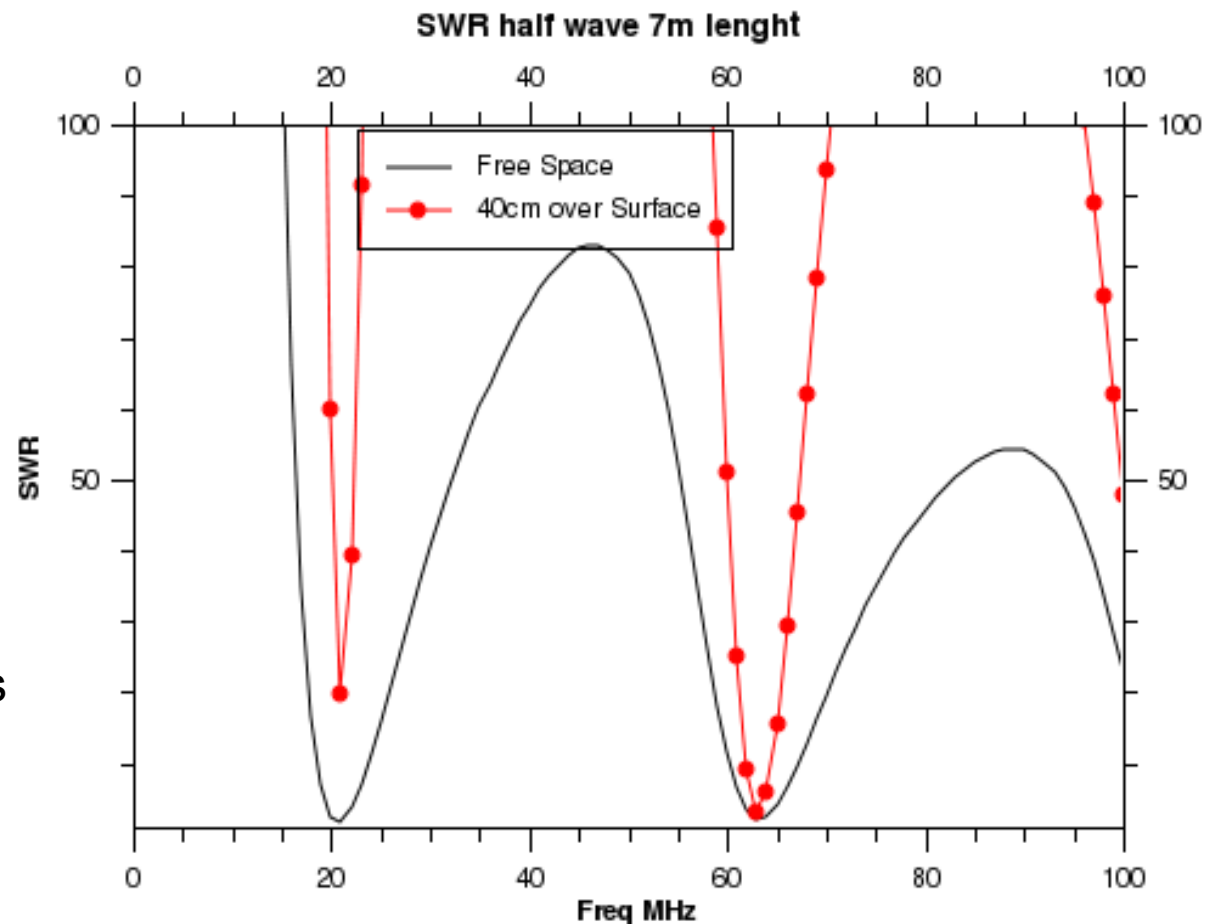

For SWR > 1 the impedance mismatch gets increasingly bad

# For Example: Dipole Antenna

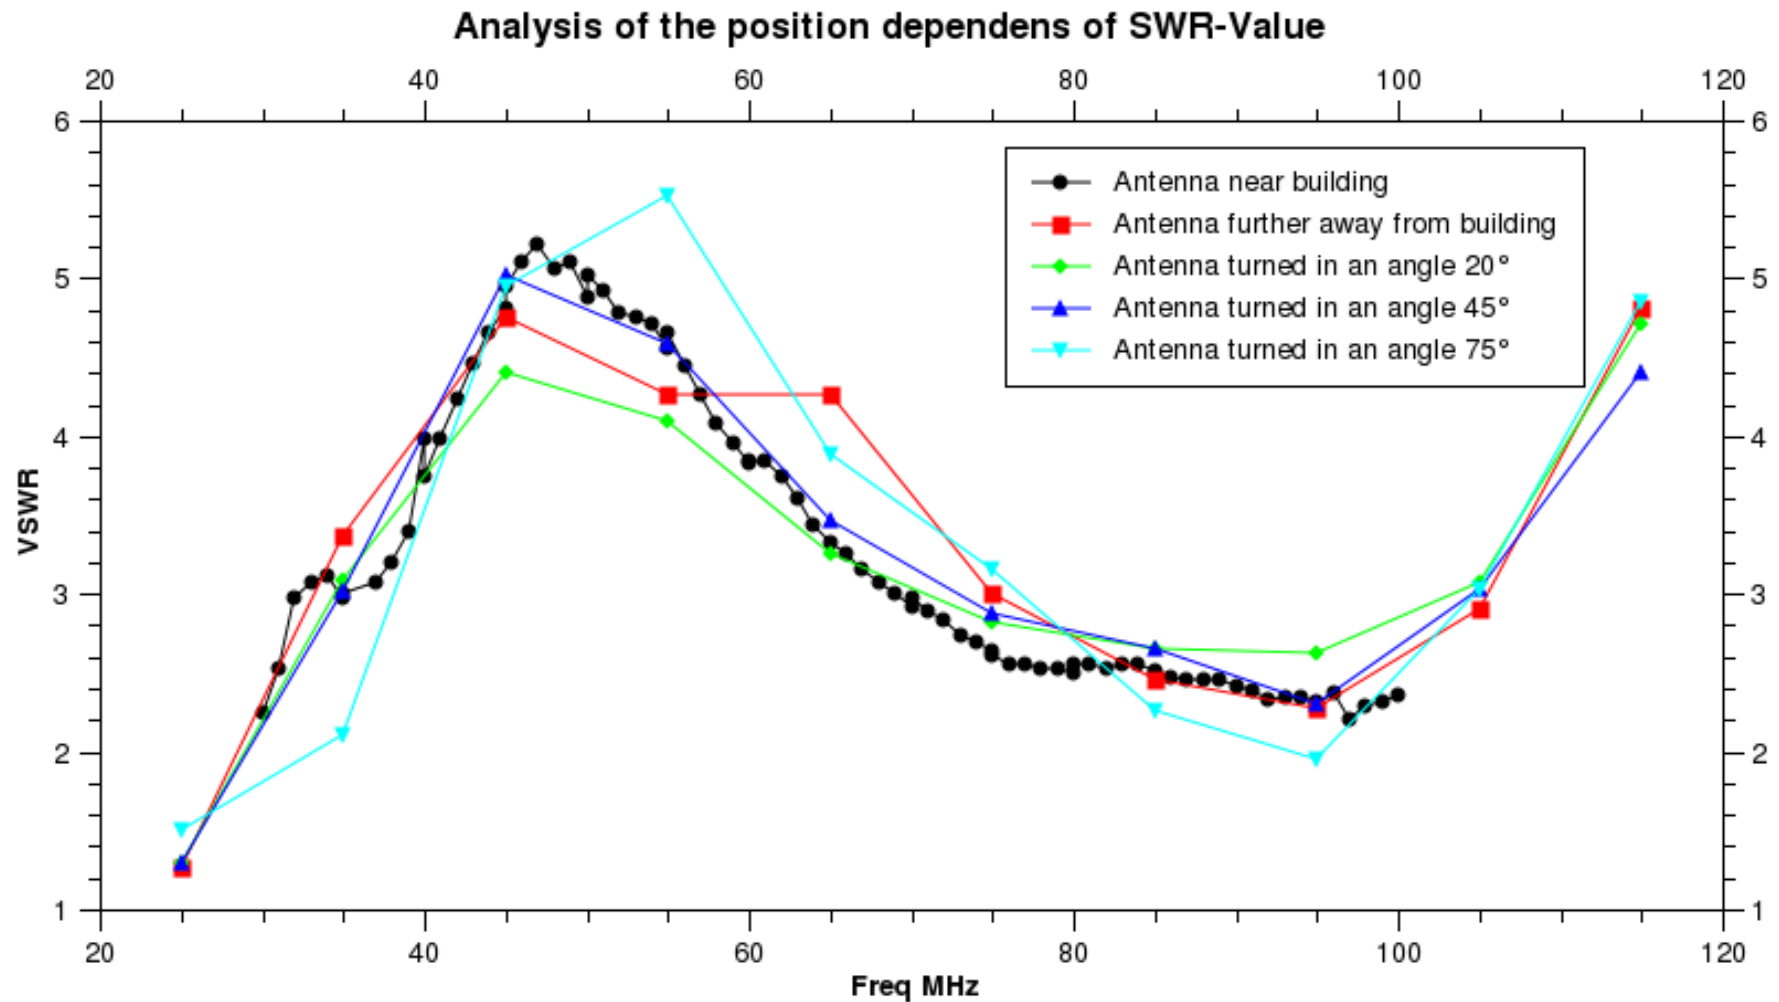

Only useful for certain frequencies

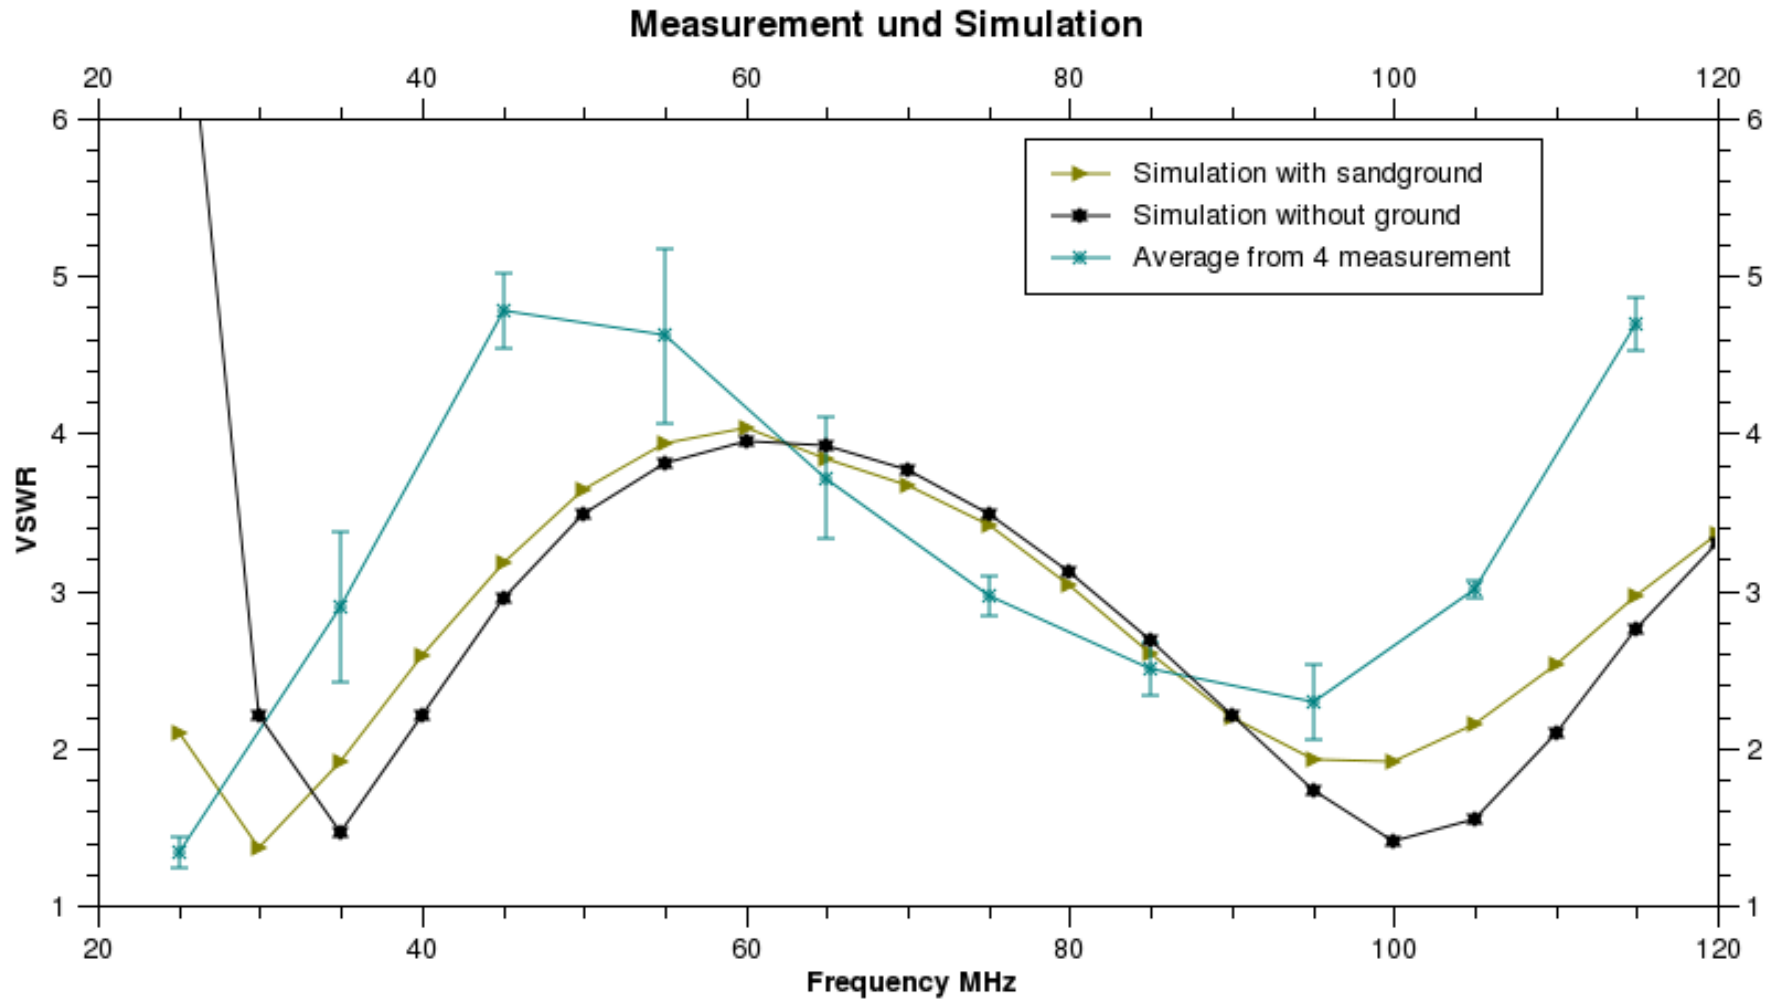

# SWR-Measurement

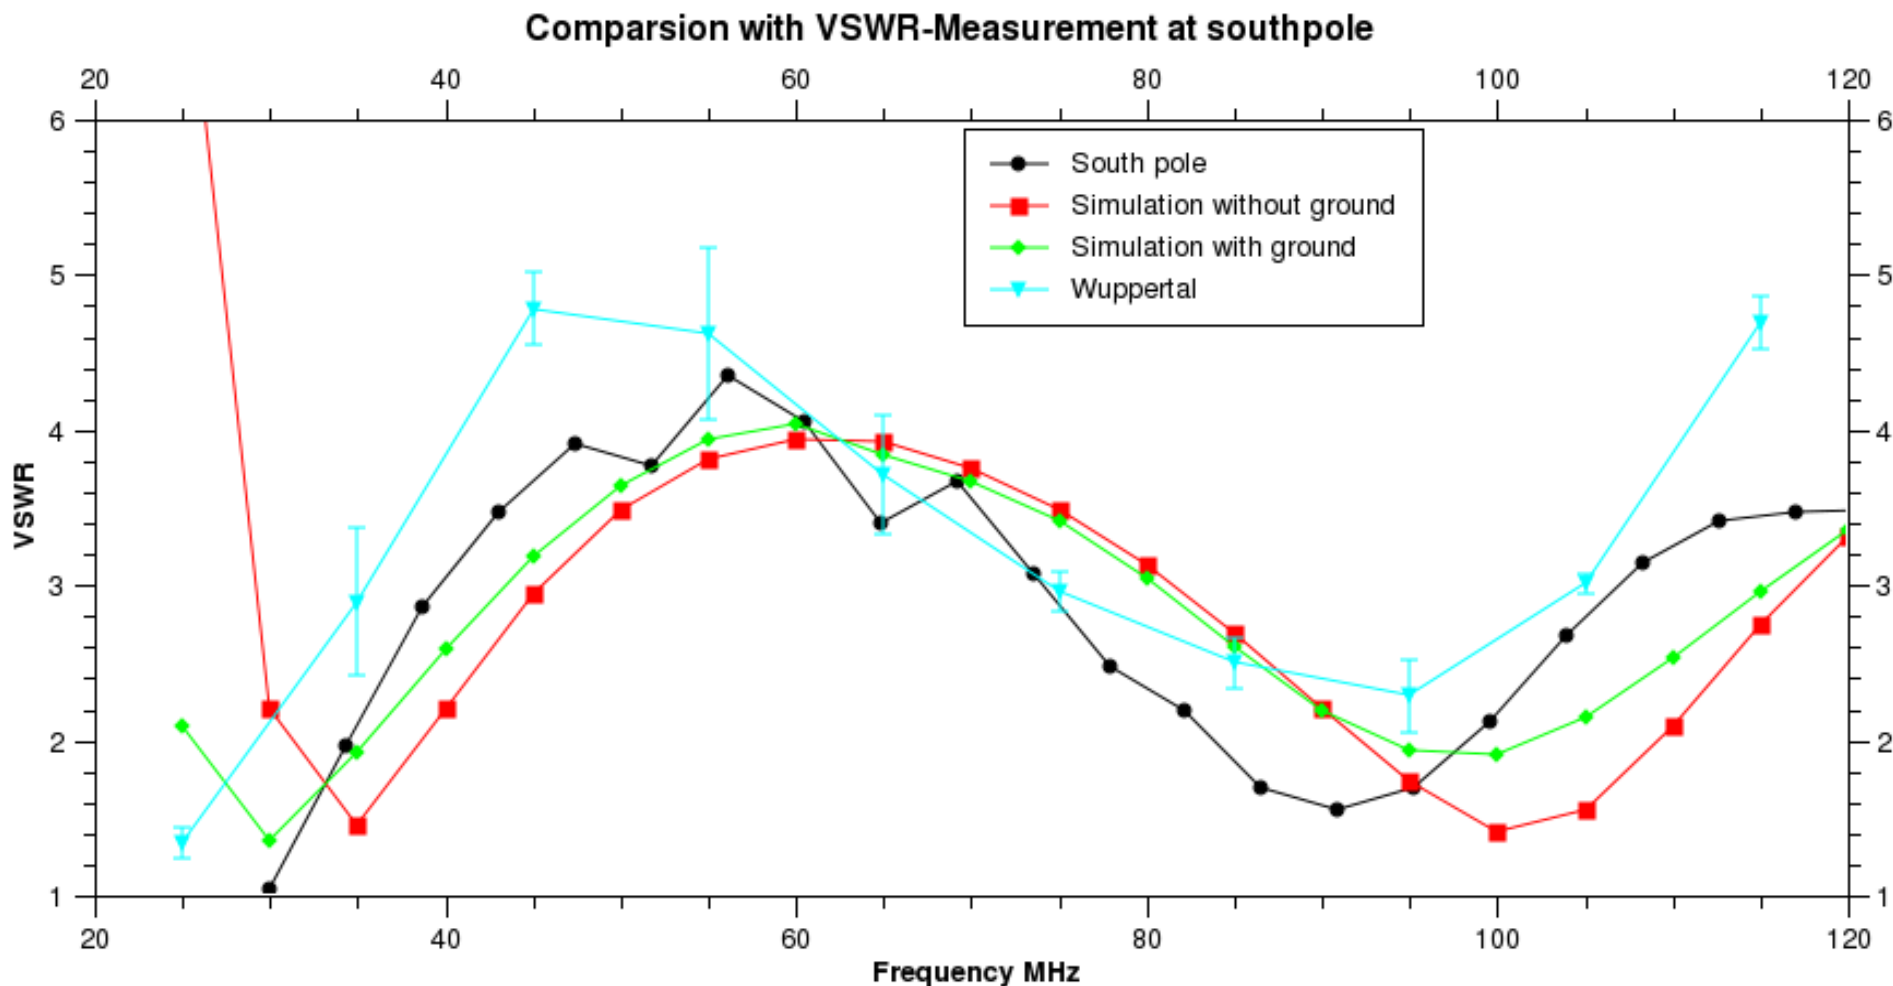

# SWR-Simulation

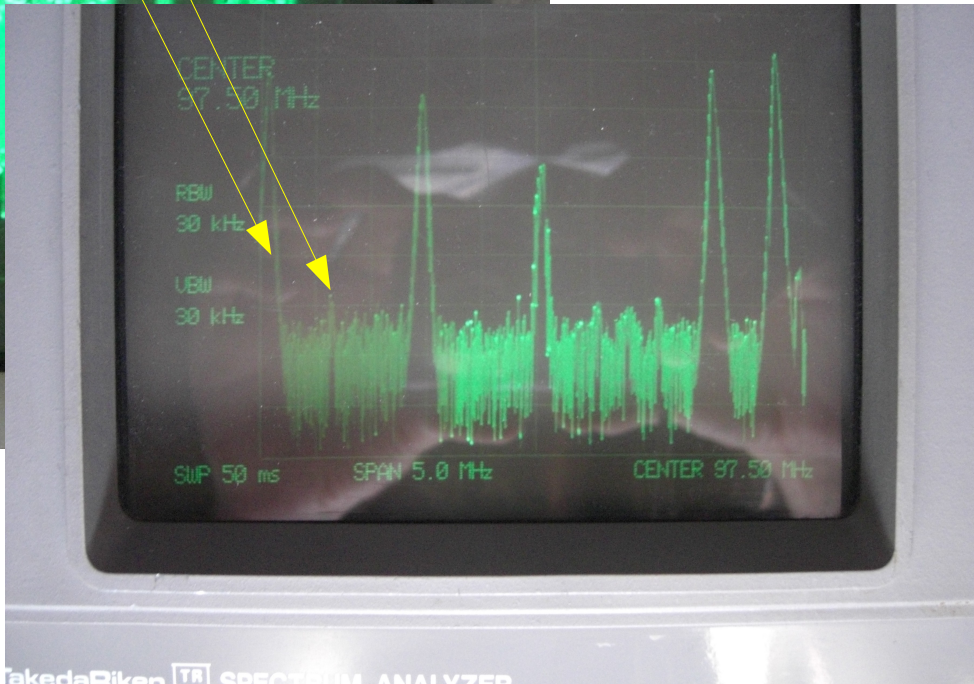

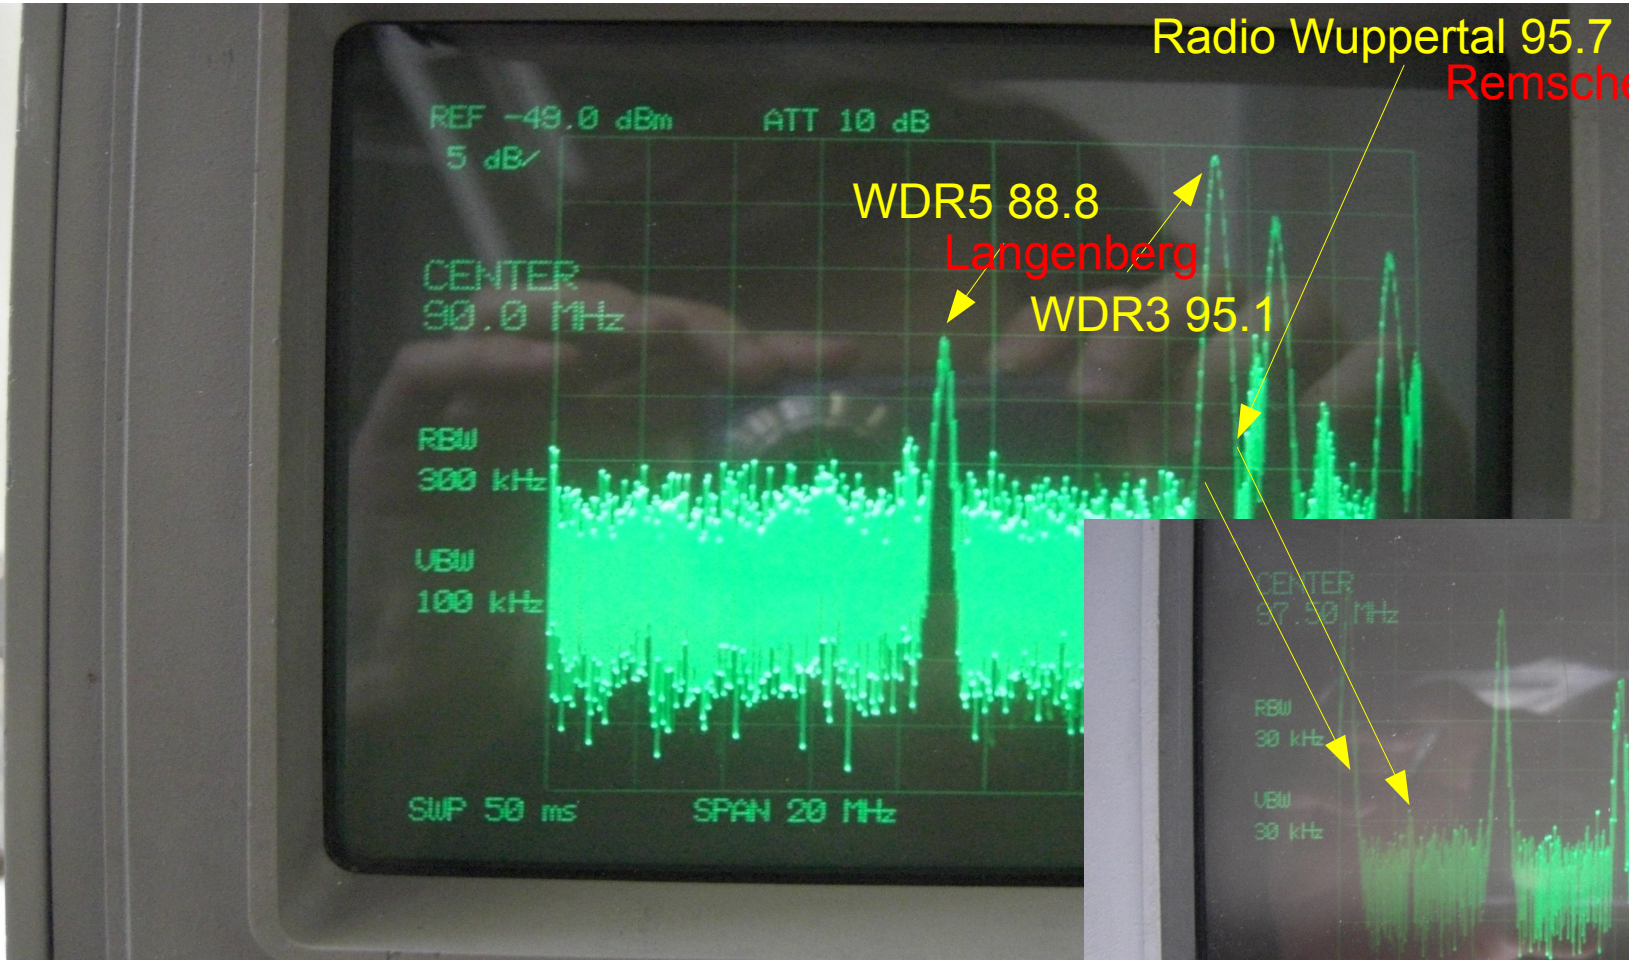

The ground have an effect on frequency shift of the VSWR value

# Measurement at south pole

Ground effects is an important point

# Spectrum

2 different radio sender station  
Langenberg and Remscheid

# Outlook

Deployment of 6 new antenna at south pole

Measurement without disturbing near field

Antenna connect to Sky-View

Simulation

Ground-Effects

Group-Delay

Impedance match
