# Outline

- Aims of the SHIPS-project
- Theory of hidden photons (HP)
- Detectors and optics
- Experimental setup

# Aims of the SHIPS-Project

- Hint of hidden photons
- Estimation of hidden photon mass and coupling parameter  $\chi$
- In any event: Further improvement of constraints to hidden sector boson parameters

# Hidden photon mass and coupling plane

# Theory of hidden photons

# Hidden photon (HP)

- Gauge boson of local  $U(1)$  hidden symmetry (common symmetry kind in String Theory)
- No direct interaction with other particles ( $\rightarrow$  hidden)

# Hidden photon (HP)

Very massive particles (mediator fermions) with both electric and hidden charge can generate kinetic mixing with the standard photon.

$$L_{mix} = -\frac{1}{4} \cdot \chi \cdot A_{\mu\nu} \cdot B^{\mu\nu}$$

(A = Photon field strength, B = HP field strength,  
 $\chi$  = coupling parameter)

# Hidden photon (HP)

- Presence of kinetic mixing term signals photon and HP fields are not orthogonal.
- Photon is by definition an interaction eigenstate (couples to electric charge), HP is generally massive.
- Kinetic mixing misaligns the interaction and propagation eigenstates of the photon.

# Hidden photon (HP)

- Misalignment of interaction and propagation eigenstates is known to produce flavour oscillations.
- VACUUM oscillation probability:

$$P(\gamma \rightarrow \gamma') = 4\chi^2 \sin^2\left(\frac{m_{\gamma'}^2 \cdot L}{4\omega}\right)$$

with  $m$  = HP mass,  $L$  = path length,  $\omega$  = photon energy

# Hidden photon (HP)

- Only photon oscillations produce hidden photons
- Oscillations make HPs from the sun detectable with telescopes, so called Helioscopes.

# Tracing hidden photons

$$N_{\gamma'} = \int \frac{d\Phi_{\gamma'}}{d\omega} \cdot A \cdot T \cdot P_{(\gamma' \rightarrow \gamma)}(\chi, m_{\gamma'}, \omega, L, \Delta n) d\omega$$

with  $m = h\nu$  mass,  $L =$  path length,  $\omega =$  photon energy,

$\Delta n = n - 1$ ,  $n$ : index of refraction of the medium

# Tracing hidden photons

$$N_{\gamma'} = \int \frac{d\Phi_{\gamma'}}{d\omega} \cdot A \cdot T \cdot P_{(\gamma' \rightarrow \gamma)}(\chi, m_{\gamma'}, \omega, L, \Delta n) d\omega$$

with  $m = h\nu$  mass,  $L =$  path length,  $\omega =$  photon energy,

$\Delta n = n - 1$ ,  $n$ : index of refraction of the medium

# Photon - hidden photon oscillations

- The probability of photon - hp oscillations is given by:

$$P(\gamma \rightarrow \gamma') = \frac{\sin^2 2\chi}{\left(\cos 2\chi + \frac{2\omega^2 \Delta n}{m_{\gamma'}^2}\right)^2 + \sin^2 2\chi} \sin^2 \frac{m_{\gamma'}^2 \cdot L \cdot \sqrt{\left(\cos 2\chi + \frac{2\omega^2 \Delta n}{m_{\gamma'}^2}\right)^2 + \sin^2 2\chi}}{4\omega}$$

with  $m$  = hp mass,  $L$  = path length,  $\omega$  = photon energy,

$\Delta n = n - 1$ ,  $n$ : index of refraction of the medium

- Oscillations are significantly smaller when  $\Delta n > 0$
- For visible light a pressure below  $10^{-4}$  mbar ensures that oscillations will not be damped

# Photon - hidden photon oscillations

- The probability of photon - hp oscillations is given by:

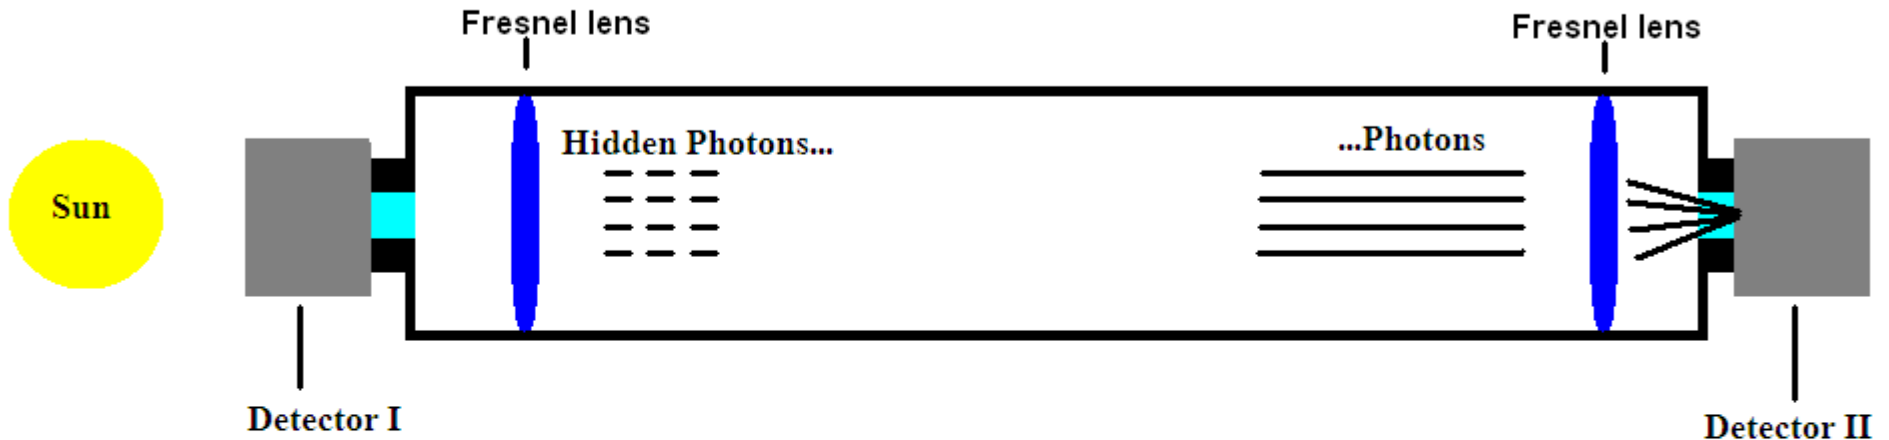

$$P(\gamma \rightarrow \gamma') = \frac{\sin^2 2\chi}{\left(\cos 2\chi + \frac{2\omega^2 \Delta n}{m_{\gamma'}^2}\right)^2 + \sin^2 2\chi} \sin^2 \frac{m_{\gamma'}^2 \cdot L \cdot \sqrt{\left(\cos 2\chi + \frac{2\omega^2 \Delta n}{m_{\gamma'}^2}\right)^2 + \sin^2 2\chi}}{4\omega}$$

with  $m$  = hp mass,  $L$  = path length,  $\omega$  = photon energy,

$\Delta n = n - 1$ ,  $n$ : index of refraction of the medium

- Oscillations are significantly smaller when  $\Delta n > 0$
- For visible light a pressure below  $10^{-4}$  mbar ensures that oscillations will not be damped

# Helioscope design

Hps have no tree level interactions with SM particles and can pass matter freely

- Vacuum:  
 $< 10^{-4}$  mbar required
- Totally shielded  
from daylight

# Detectors and optics

# Optics

Two detectors  
(fresnel lens + PMT)  
on each side of the  
helioscope allows:

- Simultaneous background measurements
- To point our helioscope at the sun continuously and over long periods

# Detectors for SHIPS

## Photomultiplier

ET Enterprises  
9125SA:

- Very low dark current (2.8 Hz) and dark current noise
- Single photons detectable
- Operated at  $-20^{\circ}\text{C}$

# Experimental setup

# SHIPS Helioscopes

## TSHIPS I:

- 26 cm x 200 cm x 3 mm stainless steel tube
- appr. 75 kg + separate detector compartments

# SHIPS Helioscopes

## TSHIPS II:

- Vault structure, lightweight, about 14.5 kg
- 2m x 25 cm x 0.8mm same size as TSHIPS I
- Significant reduction of weight (TSHIPS I 75kg)

# TSHIPS prototype

- The first data will be taken by a 4.3 m long TSHIPS prototype tube (combined TSHIPS 1 and II plus detector compartment)

# OLT - mount for TSHIPS prototype

- Oskar-Luehning-Telescope (OLT) located at the Hamburger Sternwarte will be used as mount for TSHIPS in the first phase of the project

# TSHIPS prototype mounted onto the OLT

Hidden Photon Sea

# Large SHIPS III setup

- Tube length up to 14 m and 2 m diameter
- Alt-az mount
- To be located inside a hall of the old HERA accelerator ring at DESY

Thank you very much for your  
attention

... and feel very welcome to visit:

[www.ships.uni-hamburg.de](http://www.ships.uni-hamburg.de)

# Detectors and optics

- We estimated the dark current noise  $\Phi_{noise}$  (single PMT + tube) to be 1.7 counts/sec
- The SHIPS sensitivity (with  $3\sigma$ ) is given by:

$$\Phi \simeq 3 \sqrt{\left(\frac{\Phi_{noise}}{T}\right)}$$

- Assuming a flux of one hp every 100 seconds on our SHIPS tube, a discovery would be achievable during a long term sun observation of about 1.8 days

SHIPS - Solar Hidden Photon Search

Matthias Schwarz

29

# TSHIPS I and II

- Both TSHIPS are fully functional helioscopes
- Can be combined to a 4.6 m long vacuum tube
- Both also serve also as test-bench for the much longer and wider TSHIPS III.

# SHIPS Signal

- Best HP source to be exploited is our sun
- Expected signal depends on the volume of the vacuum vessel
- Due to their oscillation from solar photons, Hidden Photons are expected to have the same spectral distribution as these.
- Measurements mainly in optical frequency range

# TSHIPS I
